

ThreadPrint

Enhanced Email Thread Printing for Microsoft Outlook

NovaPlex Business Solutions ThreadPrint is a great new light-weight application, designed to eliminate the waste associated with email printing.

As email conversations continue to grow it becomes more difficult to control the associated print waste. Printed emails often contain 'Reply' and 'Forward' conversations along with numerous disclaimers - when actually users only want to print either the latest or a particular thread within an email.

It is not unusual for users to print 5 to 10 pages only to throw 80% into the bin. The obvious cost to both the business and the environment is enormous.

ThreadPrint provides the ability to only print the latest or any individual thread within an email

ThreadPrint is designed to work seamlessly within Microsoft Outlook 2003, 2007 or 2010 and will provide extended options for printing individual threads of an email.

When users choose to print an email conversation, it will be quickly scanned for individual conversation threads and the most recent automatically selected for print. Users may optionally choose to print any other thread or the entire email.

After choosing the preferred printer, copies and collation options, each selected email thread will be rendered onto separate pages and marked with the corresponding thread number.

OUR GUARANTEE

NovaPlex are so confident that ThreadPrint will save your business money that we will offer you a money back guarantee if within 28-days you cannot realise a cost-saving.
